

AAC HIFU

High Intensity Focused Ultrasound

AAC HIFU Applications

High Intensity Focused Ultrasound (HIFU) delivers direct heat energy to the skin and the subcutaneous tissue that can stimulate and renew the skin's collagen and thus consequently improving the texture and reduces the sagging of the skin. It literally achieves the same results of a face lift or a body lift without any invasive surgery or injections, moreover, an added bonus of this procedure is that there is no downtime and also it works equally well for people of all skin colours in contrast to that of lasers and the intense pulse lights.

It's heating directly to deeper tissue in order to lift the skin. It is performed in the clinic with only ultrasound gel applied to the skin. An ultrasound screen image allows the operator to visualize the level of treatment before energy is applied to the targeted tissue. Treatment takes from 45 to 90 minutes depending on the area/areas treated.

Face

Four depths make the skin firmer and younger

- Remove wrinkles around forehead, eyes, mouth and neck
- Lifting and tightening the skin on cheeks
- Improving skin elasticity and improving the jaw line
- Tightening the skin, lifting eyebrow line
- Improving skin complexion

Body

Three depths to completely eliminate cellulite

- Remove fat from arms, armpits, chest, sides, abdomen, thighs, calves, ankles and much more.

ACC HIFU Q&A

How long until I see results?

You should see results within the first 20 days after the treatment. Results will continue to improve in the following weeks

How long will the results last?

It is important to remember that this will vary from person to person. Results can last for up to 6 months. If you take care of your skin, then you will see long-lasting effects from just one treatment!

How many treatments will I need?

This will depend on your needs and expectations. The procedure can produce long-lasting results, but some people may benefit from a top-up treatment. However, most of our clients see effective results from only one treatment.

What areas can it be used for?

The AAC HIFU is ideal for treating signs of ageing around the eyes, and mouth. It can also help to reduce sagging skin on the cheeks. Depending on the area of the face, different intensities of the ultrasound will be used. In particular, lower levels of ultrasound are used around the mouth and above the eyes, because the skin is thinner and more sensitive. Furthermore, the AAC HIFU can also target skin on the neck and décolletage. This helps to reduce signs of double chins, and leave you with a tighter and firmer neck.

Is it safe?

The AAC HIFU is a safe and non-invasive procedure. Our equipment and the treatment is certified. We use the latest and most advanced technology to offer treatments that are designed around your comfort and safety.

How long will I need to recover?

This is the best part about the AAC HIFU – there is no downtime! You may experience mild redness after the treatment, but this will fade within a few days. After the treatment, you can resume your daily activities immediately, with brighter and fresher feeling skin.

FUNCTIONS

Precise HIFU transducers deliver energy to collagen to remove facial wrinkles and sagging skin and tighten body tissues.

Face

Four multi-depth cartridges directly transfer ultrasound energy into multiple layers of the face to trigger collagen renewal for a tighter, younger complexion. The 2.0mm cartridge can also treat both narrow and sensitive contours with a slimmer transducer and faster shot speed.

Body

Macro-focused cartridges at 6.0mm, 9.0mm, and 13.0mm directly transfer an equal distribution of ultrasound energy into the subcutaneous tissue of multiple body areas, inducing contractions as well as naturally disposing of stubborn fat cells for contouring purposes.
